STKIP PGRI Jombang, Jombang, Indonesia

aang.stkipjb@gmail.com

Abstract

Speaker produces paratones in communication (giving information to other). The phenomenon encourages the writers to conduct this study on paratone in news discourse. This study emphasizes on how paratones in news discourse produced by students. This study employs descriptive qualitative research. The data of this study is spoken monologue. The data are obtained through recording the subjects while they are reading. The subjects use a microphone and laptop in recording process through adobe audition 1.5. In term, students read the texts and their speech production is analysed through pitch tracks and spectrograms using speech analyzer. Based on the findings, students produce some paratone patterns in both deductive and inductive paragraphs, mainly: a) major – major paratone pattern, b) major – minor paratone pattern, c) minor – major paratone pattern, and d) minor – minor paratone pattern. Next, the use of paratone patterns in both deductive and inductive paragraphs are: a) to tell information, b) to indicate a topic-shift, c) to emphasize on the sentence that is considered the important one. Then, there are two factors that influence students to produce certain paratone patterns, mainly: students' first language and knowledge.

Key words: *Paratone, Spoken Discourse, Pattern, Pitch.*

1. INTRODUCTION

Paratone is defined as the phenomenon when speakers raise their pitch range at the beginning of topic and decline it at the end. The phenomenon is happened when speaker wants to leave one topic to the next topic. (Alonso, 2002) points out that in discourse terms, the paratone verbalizes a topic, and is particularly easy to identify in the planned speech which characterizes lessons, lectures and other expository genres. It is usually found in analyzing news discourse.

The phenomenon encourages the writers to conduct this study on paratone in news discourse. This study emphasizes on how the paratone in news discourse produced by students. Having identified topic-shift, we can find out students' paratone. Besides, the writers are eager to find the paratone patterns are produced by students, the use of paratone patterns produced by students, and the factors that influence students to produce certain paratone patterns. In this case, the researcher employs Hirst and Cristo's theory (1998) about paratone in analyzing data. The analysis leads to a deeper understanding of the paratone in news discourse produced by students.

2. METHOD

This study employs descriptive qualitative research. The data of this study is spoken monologue. The data is obtained through recording the subjects while they are reading. The subjects use a microphone and laptop in recording process through adobe audition 1.5. They are reading VOA texts. The texts are delivered by Alex Villarreal in VOA special English technology report and Lapidus. In term, students read paragraphs and their speech production are analysed through pitch tracks and spectrograms using speech analyzer. Analyzing students' voice, the writers use speech analyzer to investigate how the paratone patterns in spoken discourse produced by students.

3. DISCUSSION

3.1. Discussion about Paratone Patterns Produced by Students

In news discourse, speakers deliver their speech in some paratone patterns. This research finds out four paratone patterns produced by students in both deductive and inductive paragraphs, especially: major – major paratone pattern, major – minor paratone pattern, minor – major paratone pattern, minor – minor paratone pattern.

Based on the findings that students usually produce the different paratone patterns in speech. They produce major – major paratone pattern, minor – major paratone pattern, and minor – minor paratone pattern. There are only some students who produce major – minor paratone patterns as pointed out by Hirst and Cristo, 1998. The paratone patterns are started by major paratones and ended by minor paratones. Most students do not produce major – minor paratone pattern in each paragraph. Actually, the each paragraph should be read by using major – minor paratone pattern. But, students produce other paratone patterns. Besides students, VOA also produces different paratone pattern. VOA's paratone pattern is major – major paratone pattern. VOA and students should produce major – minor paratone patterns in indicating topic-shift. Since

major – minor paratone is as an rule and method in speech, includes reading aloud. There are only some students who produce the good speech or obey the rules or principle of speech. It can be concluded that the theory is different enough toward the fact. This research finds out four paratone patterns produced by students. But, there is only one paratone pattern as proposed by (Hirst and Cristo, 1998) that become rule in speech or reading aloud teoritically.

This research also finds out two kind of paratones as proposed by (Hirst and Cristo, 1998), especially: major paratone and minor paratone. Major paratone is marked by extra high pitch, high pitch, or mid pitch. On the other hand, minor paratone is signed by low pitch or extra low pitch. Both major and minor paratones produced by high, mid, and low proficiency levels students. There are many major paratones produced by students in all paragraphs. The most major paratones are found in the second paragraph of the first text. The paratones are lied on the words "Howard Lichtman" and "the need for travel" in the second paragraph of the first text. Besides in deductive paragraphs, major paratones are also found in inductive paragraph. Major paratones are produced by students, since their vocal cords often vibrate faster.

Although students generally use many major paratones, they also use minor paratones in both deductive and inductive paragraphs particularly. In sum, students also produce minor paratones in all paragraphs. Minor paratones are also found in both deductive and inductive paragraphs. The most minor paratones are found in the first paragraph of the second text. The paratones are lied on the words "Miles Copeland" and "America" in the first paragraph of the second text. In brief, it can be concluded that students use many major paratones than minor paratones in both deductive and inductive paragraphs. In general, students use many major paratones than minor paratones in deductive and inductive paragraphs. There are 123 major paratones and 107 minor paratones. The number of major paratones produced by students is higher than the number of minor paratones in both deductive and inductive paragraphs. Major paratones are produced by students, since their vocal cords often vibrate faster. That's why, minor paratones are seldom produced by students. It depends on the vibration of vocal cords. If speakers vibrate their vocal cords faster, it is going to be produced the extra high, high and mid pitches (major paratone). On the contrary, if speakers vibrate their vocal cords slowly, it is going to be produced the low and extra low pitches (minor paratone). Based on the findings, most female students produce extra high pitch, high pitch and mid pitch and most male students produce low and mid pitches in their paratone production. It happened that most female students tend to talk active. Their vocal cords tend to vibrate faster. So, the phenomenon cause them tend to produce extra high pitch, high pitch and mid pitch (major paratones). This is in line with (Halim, 1974), that female individuals tend to exhibit larger intervals than male individuals. In sum, paratone production based on the gender of speaker. The male speaker tends to produce minor paratone and the female speaker tends to produce major paratone.

On the other hand, the use of pitches (extra high, high, mid, low, and extra low pitches) don't have influence toward the meaning of word. The rising or falling pitch doesn't distinguish the meaning. If speakers utter something (for example: /systems/) by using extra high, high, mid, low, or extra low pitch, the meaning of word "systems" will be same.

3.2. Discussion about the Use of Paratone Patterns Produced by Students

Students deliver their speech in some paratone patterns. Based on the findings this research finds out the use of paratone patterns produced by students in both deductive and inductive paragraphs.

a. To Tell information

Based on the findings of this research, students (in high proficiency level) tend to use major – major paratone patterns in both deductive and inductive paragraphs. But, the pattern is often used by most high and mid proficiency level students. They use the pattern in all paragraphs. In term, the students want to tell information. Besides, students use minor - minor paratone patterns in deductive and inductive paragraphs. They also use them to tell information. But, the patterns are used by low proficiency level students. They use the pattern in all paragraphs.

The phenomenon is caused by the intend of speakers. In their mind, the paragraph is exposition paragraph who consists of declarative sentences. So, they want to tell or inform the listeners by using major – major paratone pattern or minor – minor paratone pattern.

b. To Indicate a Topic-shift

Besides telling information, paratone pattern is also used to indicate a topic-shift. Actually, students tend to use major – minor paratone pattern to indicate a topic-shift. Major – minor paratone pattern is used by students in both deductive and inductive paragraphs. The pattern

is started by major paratone and ended by minor paratone. The phenomenon happened when students want to leave one topic to the next topic. In term, the paratone verbalizes a topic and is particularly easy to identify in the planned speech which characterizes news item paragraphs. Actually, the paratone patterns are used by mid proficiency level students.

c. To emphasize on the sentence that is considered the important one

In fact, some students tend to use minor – major paratone patterns for emphasizing on the sentence that is considered the important one or to mark special emphasis. Minor – major paratone patterns are also found in both deductive and inductive paragraphs. The pattern is initialled by minor paratones and ended by major paratone. In their mind, the last sentence of the paragraph is the main sentence. So, they use the paratone pattern. Actually, low proficiency levels students use minor – major paratone patterns in both deductive and inductive paragraphs.

Based on the findings that students produce four paratone patterns in speech. They produce major – major paratone pattern, major – minor paratone pattern, minor – major paratone pattern, and minor – minor paratone pattern. There are only some students who use major – minor paratone patterns to indicate a topic-shift. Topic shift is viewed as the transition phase between two segments in topics. It adopted by students to break a moment. Actually in reading paragraphs (deductive or inductive paragraphs), students tend to read one topic. Then, they shift and read it into a new topic. In this case, major – minor paratone pattern is needed to signal topic shift. The paratone patterns are initialled by major paratones and ended by minor paratones. But, most students use the other paratone patterns to the other aim, mainly: to emphasize on the sentence that is considered the important one or to mark special emphasis, to tell information. VOA also uses major – major paratone pattern to tell information. In sum, paratone pattern production depends on the aim of speaker. It is showed by the appearance of some paratone patterns produced by speaker. Speaker uses certain paratone pattern to show the certain aim of speaker in speech.

3.3. Discussion about the Factors Influencing Production of Certain Paratone Patterns by Students

In this study, there are four kinds of paratone patterns, such as: major – major paratone pattern, major – minor paratone pattern, minor – major paratone pattern, and minor – minor paratone pattern. In fact, there are some students who tend to use the first paratone pattern, the second paratone pattern, the third paratone pattern, even the fourth paratone pattern. Based on the findings, there are two factors that influence students to produce certain paratone patterns, mainly: students' first language and knowledge. In paratone patterns production, students' first language and knowledge influence students to produce certain paratone patterns. Their first language plays significant role toward paratone patterns production as viewed by (Brown, 2000) He views that learning second language is a long and complex undertaking. Your whole person is affected as you struggle to reach beyond the confines of your first language and into a new language, a new culture, a new way of thinking, feeling, and acting. It's meant that the first language has a great effect toward second language acquisition. In fact, students tend to use the intonation of the first language to produce the intonation of second language (English). Because of the effect of their first language, students' intonation in telling information (declaration) tend to be flat. In brief, their first language influence paratone patterns production. Next, their knowledge (especially prior knowledge) are also influence their paratone patterns. Knowledge as one of factors that influence students to produce certain paratone patterns plays crucial role in learning English as second language. It is in with (Lou, et al. 2005) who view that knowledge is just a stepping stone to being able to use the language. Based on the findings, students' knowledge about English intonation is low. In their mind, phonology especially intonation is the difficult one. Besides, considering intonation they also consider the pronunciation. In fact, there are only some students who learn and know appropriate intonation in English well. On the other hand, there are many students who judge that reading aloud is difficult. Students have different opinions about reading aloud. There are some students who judge that reading aloud is easy and difficult. Some students propose that reading aloud is difficult. In their mind, not only reading aloud but also they must have good pronunciation. They must know pronunciation and intonation well. They judge themselves that their pronunciation is bad, so they don't have confidence in reading aloud. Broadly speaking, students usually have different ways in reading aloud. There are some students who notice the way of good reading and some students who don't notice the way of good reading. there are some students who notice the way of good reading. Actually there are many students who realize that

reading is difficult. That's why, they notice the way of good reading. Whereas, there are some students who don't notice the way of good reading. So they never notice the way of good reading.

4. CONCLUSION

a. Paratone Patterns Produced Used by Students

There are some variations of paratone patterns produced by students and VOA in both deductive and inductive paragraphs. They are: major – major paratone pattern, major – minor paratone pattern, minor – major paratone pattern, minor – minor paratone pattern.

b. The Use of Paratone Patterns Produced by Students.

Using paratone patterns in both deductive and inductive paragraphs, students produce some paratone patterns for certain aims: 1) the use of major – major paratone pattern and minor – minor paratone pattern are to tell information, 2) the use of major – minor paratone pattern is to indicate a topic-shift, and 3) the use of minor – major paratone pattern is to emphasize on the sentence that is considered the important one.

c. The Factors Influencing Production of Certain Paratone Patterns by Students

There are two factors influencing production of certain paratone pattern. The factors can be seen from meaning and phonology. They are: students' first language and knowledge. In paratone patterns production. Their first language plays significant role toward paratone patterns production. Because of their first language, students' intonation in telling information (declaration) tend to be flat. Besides, their knowledge are also influence their paratone patterns. In fact, their knowledge about English intonation is low. In their mind, phonology especially intonation is the difficult one.
